Dept. of Clinical Pharmacy & Toxicology

L U Leiden University
M C Medical Center

Background

- Results of 5 available RCTs for a variety of drug-gene combinations strongly indicate that PGx testing prior to prescribing (and thus personalizing medicine) leads to improved patient outcome [1-5]
- ~15% of medicinal products evaluated according to EMA centralized procedure between 1995 - 2014 contain PGx information in their label that directly impacts patient treatment [6]
- Availability of Dutch Pharmacogenetics Working Group and CPIC guidelines for >80 gene-drug pairs

1. NEJM 2008;358:569#79
2. NEJM 2013;369:2304#12
3. NEJM 2013;369:2294# 303
4. Lancet 2015

5. Coenen et al Gastroenterology 2015
6. Ehmann et al. Pharmacogenomics J. 2015

Survey physicians and pharmacists

- 97.6% of physicians agreed that genetic variations may influence drug response [1]
- 99.7% of pharmacists agreed that a patients' genetic profile may influence drug response [2]
- *Did you order or recommend a pharmacogenetic test in the preceding 6 months?* [2]

Yes

4%

~400 GP's

15%

~667 pharmacists

Current Evidence Supporting Pre-emptive Pharmacogenomics

- Gold standard evidence for a variety of **single drug-gene pairs**:

Drug	Clinical Endpoint	Variant
Abacavir	hypersensitivity	HLA-B*5701
Acenocoumarol / Fenprocoumon	% time between therapeutic INR	VKORC1/CYP2C9
Warfarin	% time between therapeutic INR	VKORC1/CYP2C9
Warfarin	% time between therapeutic INR	VKORC1/CYP2C9
Mercaptopurine	leucopenia	TPMT

➤ Sufficient evidence supporting that pre-emptive PGx can lead to improved patient outcome

Evidence base is limited to single drug-gene pairs

PGx Testing for a Panel of Pharmacogenes may be more Relevant

- PGx results are lifelong
- Patients may initiate a number of drugs during their life time which can be more optimally prescribed using PGx
- Actionable PGx variants are common in the population

**Limited
evidence
supporting a
panel approach**

- 95% of patients have at least 1 actionable genotype

U-PGx Consortium: Generating Evidence to Support Pharmacogenomics

- **Objective:** to quantify the collective clinical utility of a panel of PGx-markers
1. **Systematic implementation of pre-emptive PGx strategy across multiple:**
 - drugs/genes/ethnicities/healthcare systems
 2. **Robust assessment of how this intervention impacts:**
 - Patient care (individual and on a population level)
 - Healthcare service processes
 - Cost-effectiveness

Ubiquitous Pharmacogenomics

Making actionable pharmacogenomic data and effective treatment optimization accessible to every European citizen

Call identifier : H2020-PHC-24-2015-two-stage
Proposal No: 668353-I
Acronym: U-PGx

U-PGx | Ubiquitous Pharmacogenomics

- **Funded by EU Horizon 2020 (€15 million)**
- **Start 1-1-2016**
- **5 year project**
- **Implement pre-emptive PGx testing in a real world setting across 7 European sites**
 - Using the DPWG guidelines to guide drug and dose selection

safety-code
The Medication Safety Code initiative

What is it?
The Medication Safety Code on the left represents a patient-specific genetic profile regarding important pharmacogenes.

How does it work?
After scanning the QR code (e.g. with a smartphone), you are led to a website that displays patient-specific drug dosing recommendations.

Laboratory contact

U-PGx | Ubiquitous Pharmacogenomics

Component 2: PREPARE Study

Objective:

To quantify the collective clinical utility of a panel of PGx-markers covering 13 important pharmacogenes as a new model of personalized medicine

Hypothesis:

Implementation will result in a 30% reduction of **clinically relevant** adverse drug reactions (4 → 2.8%)

Design:

Open randomized cross-over study in 7 countries including 8,100 patients.

Outcomes:

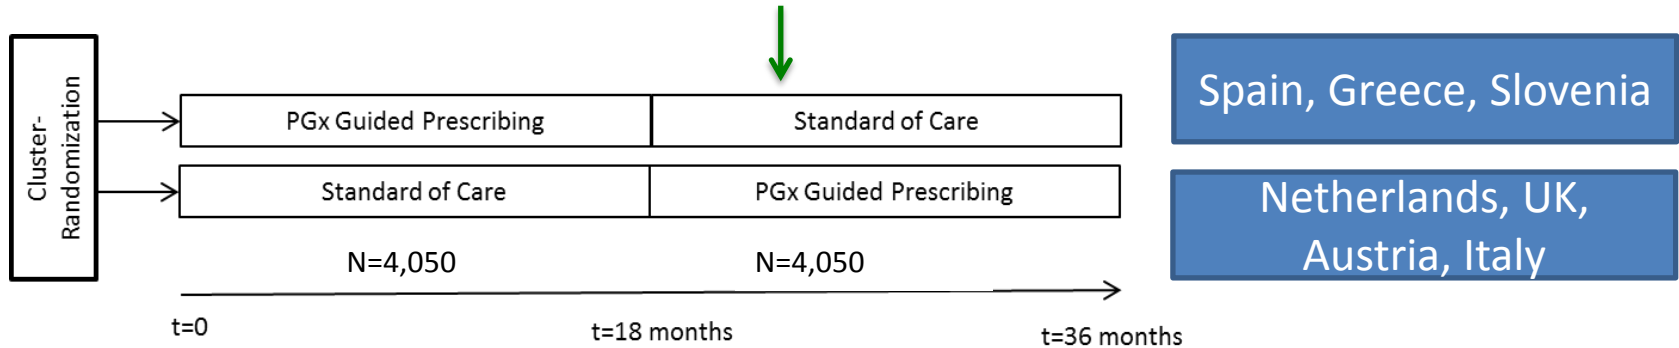

Primary	Clinical outcome
Secondary	Process indicators for implementation
	Cost-effectiveness

PREPARE

PREemptive **P**harmacogenomic testing for preventing **A**dverse drug **RE**actions

New set of patients

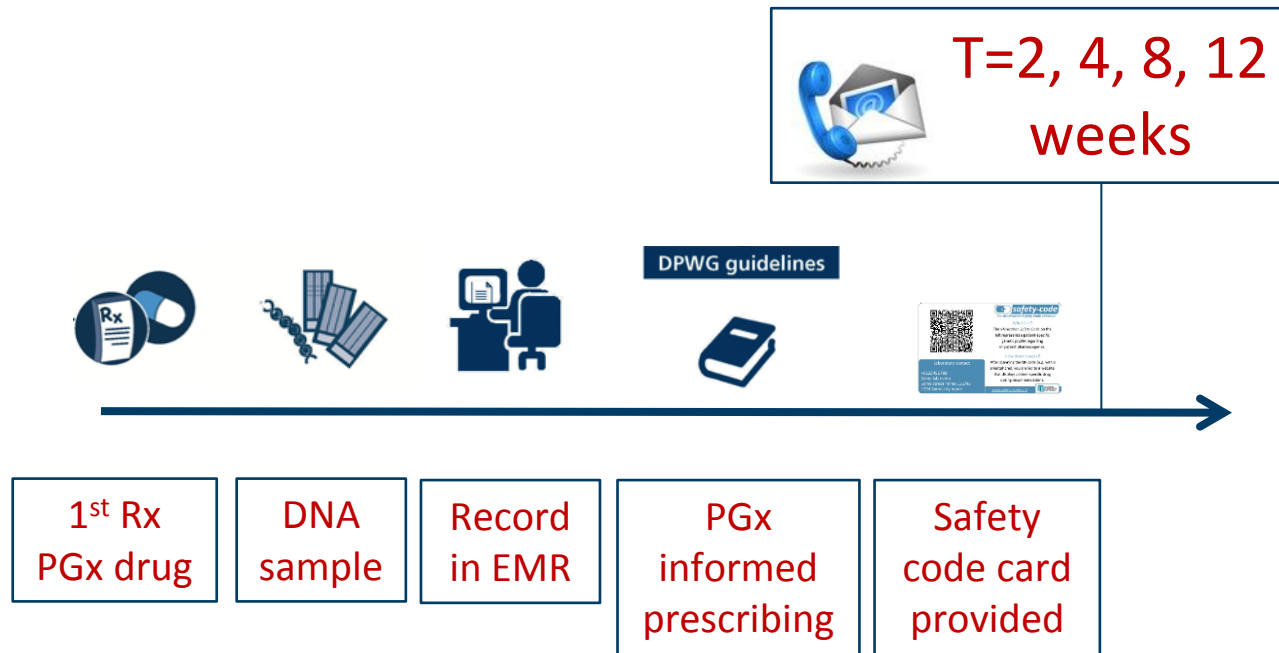

Each site has its own therapeutic focus

U-PGx | Ubiquitous Pharmacogenomics

PGx Guided Prescribing Arm

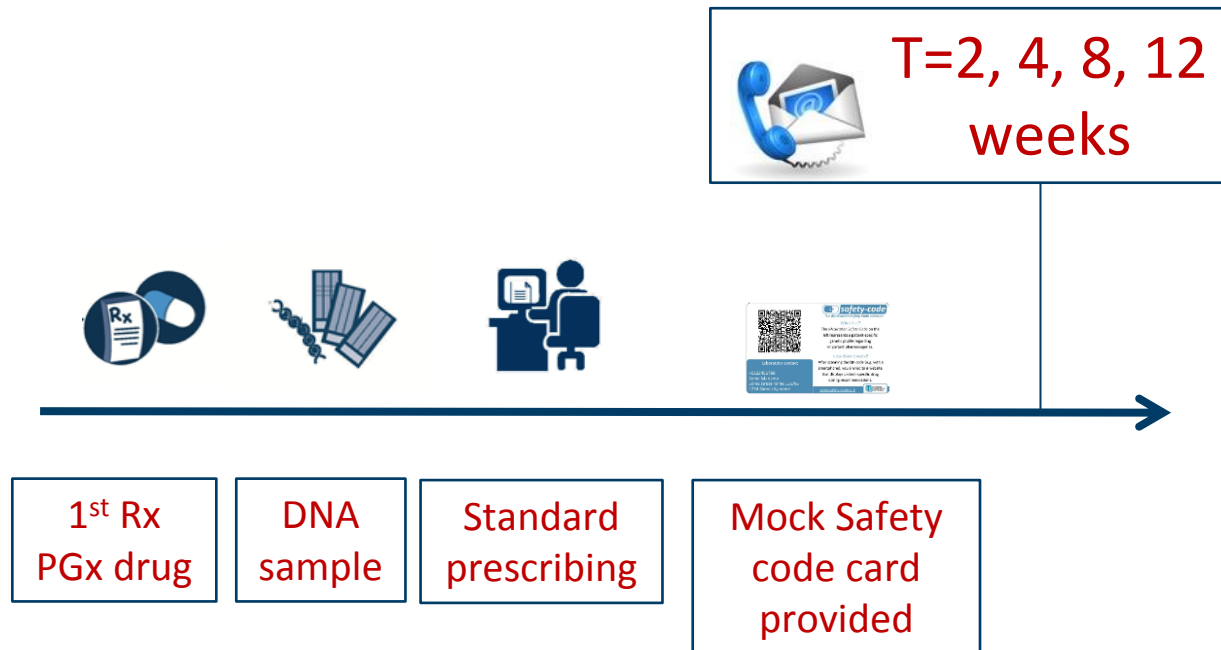

Drugs of inclusion (n=42)

Antiarrhythmic	Flecainide	Antiepileptic	Carbamazepine
	Propafenon		Phenytoin
Analgesic	Codeine	Antihypertensive	Metoprolol
	Oxycodone	Anti-infective	Efavirenz
	Tramadol		Flucloxacillin
Anticancer	Capecitabine		Voriconazole
	Fluorouracil	Antipsychotic	Aripiprazole
	Irinotecan		Clozapine
	Tamoxifen		Haloperidol
	Tegafur		Pimozide
Anticoagulant	Acenocoumarol		Zuclopenthixol
	Clopidrogel	Cholesterol-lowering	Atorvastatin
	Phenprocoumon		Simvastatin
	Warfarin	Immunosuppressant	Azathioprine
Antidepressant	Citalopram		Mercaptopurine
	Escitalopram		Tacrolimus
	Paroxetine		Thioguanine
	Sertraline		Psychostimulant
	Venlafaxine		
Antidepressant (TCA)	Amitriptyline		
	Clomipramine		
	Doxepine		
	Imipramine		
	Nortryptiline		

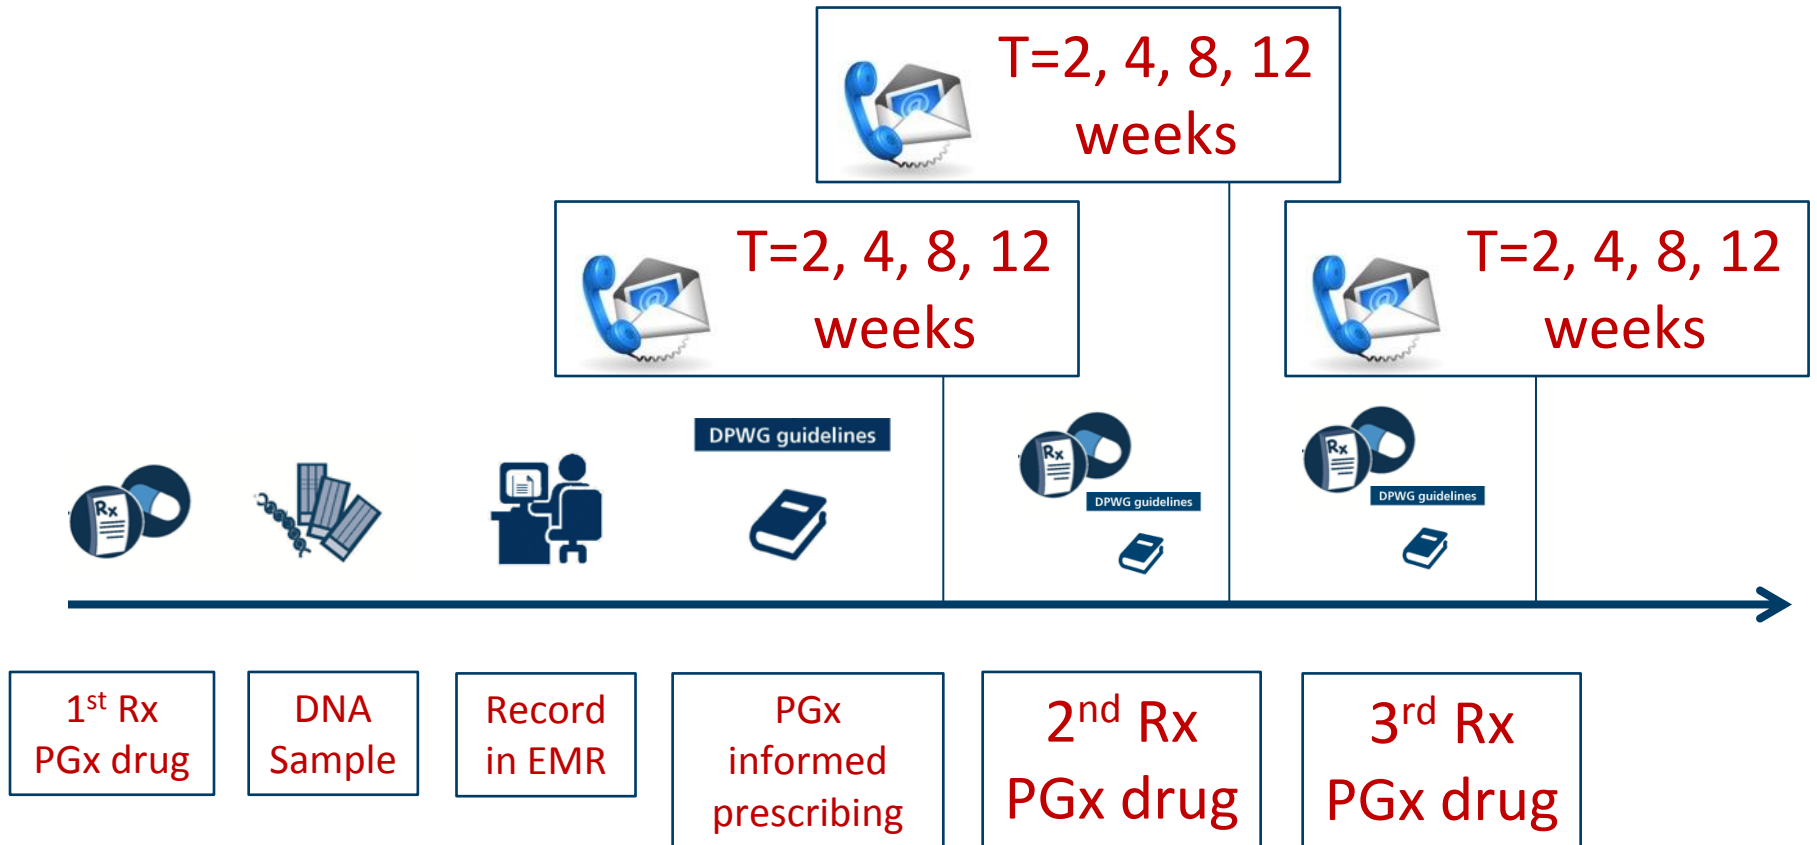

- PPIs excluded because they are only associated with a difference in efficacy among aberrant genotypes
- Estrogen containing drugs will only be included in the study as a subsequent prescription.

Standard of Care Arm

Subsequent Prescriptions of Interest

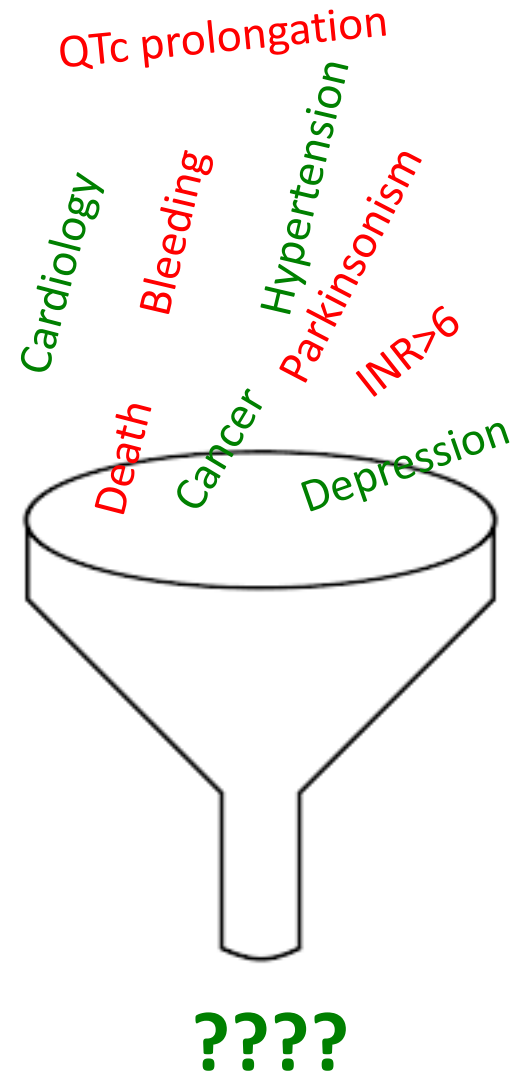

~50% 2nd prescription

~30% 3rd prescription

Endpoint

- DPWG guidelines for 84 gene-drug pairs
- Variety of drugs and diseases
- → Composite endpoint

Endpoint based on the DPWG

- Systematic review literature
 1. Score 'level of evidence'
 - 1-4
 2. Score 'clinical relevance'
 - A-F, derived from CTC-AE
 - CDEF=2345

Classification of clinical relevance

Classification of clinical relevance

AA Clinical effect (NS)
Kinetic effect (NS)

A Minor clinical effect (S): QTc prolongation (<450 ms ♀, <470 ms ♂), INR increase <4.5
Kinetic effect (S)

B Clinical effect (S): short-lived discomfort (<48 h) without permanent injury, for example, reduced decrease in resting heart rate, reduction in exercise tachycardia, diminished pain relief from analgesics; ADE resulting from increased bioavailability of tricyclic antidepressants (decreased renal clearance, hepatic impairment, etc.)

C Clinical effect (S): long-standing discomfort (48–168 h) without permanent injury, for example, increase risk of failure of therapy with tricyclic antidepressants or atypical antipsychotic drugs: extrapyramidal side effects, parkinsonism; ADE resulting from increased bioavailability of tricyclic antidepressants, metoprolol, propafenone (central effects, e.g., dizziness).

D Clinical effect (S): long-standing effect (>168 h), permanent symptom or invalidating injury, for example, failure of prophylaxis of atrial fibrillation; deep vein thrombosis

E Clinical effect (S): Increased risk of failure of lifesaving therapy; expected bone marrow depression

F Clinical effect (S): death; arrhythmia; unexpected bone marrow depression

ADE, adverse drug event; INR, international normalized ratio; NS, not statistically significant difference; S, statistically significant difference.

CTC-AE

Most gene-drug pairs related to ADRs

3

4

5

Endpoint - 7-point clinical relevance ADR scale

Class	EMA ADE frequency	Clinical Effect
AA#		Positive clinical effect (NS)
AA		Clinical effect (NS): no change or a non-significant change of clinical parameters Kinetic effect (NS): no change or a non-significant change of kinetic parameters.
A	Common ≥ 1/100 to < 1/10	Minor clinical effect (S): QTc prolongation (<450 ms ♀, <470 ms ♂); QTc time increase < 60ms; INR increase < 4.5 Kinetic effect (S): significant change of kinetic parameters
B	Common ≥ 1/100 to < 1/10	Clinical effect (S): short-lived discomfort (< 48 hr) without permanent injury: e.g. reduced decrease in resting heart rate; reduction in exercise tachycardia; decreased pain relief from oxycodone; ADE resulting from increased bioavailability of atomoxetine (decreased appetite, insomnia, sleep disturbance, depressive mood, etc); neutropenia > 1.5x10 ⁹ /l; leucopenia > 3.0x10 ⁹ /l; thrombocytopenia > 75x10 ⁹ /l; moderate diarrhea not affecting daily activities; reduced glucose increase following oral glucose tolerance test; muscle complaints creatine kinase <3 times normal upper limit
C	Common ≥ 1/100 to < 1/10	Clinical effect (S): long-standing discomfort (48-168 hr) without permanent injury e.g. failure of therapy with tricyclic antidepressants, atypical antipsychotic drugs; extrapyramidal side effects; parkinsonism; ADE resulting from increased bioavailability of tricyclic antidepressants, metoprolol, propafenone (central effects e.g. dizziness); increased INR 4.5-6.0; neutropenia 1.0-1.5x10 ⁹ /l; leucopenia 2.0-3.0x10 ⁹ /l; thrombocytopenia 50-75x10 ⁹ /l; muscle complaints creatine kinase 3-10 times normal upper limit
D	Uncommon ≥ 1/1,000 to < 1/100	Clinical effect (S): long-standing discomfort (> 168 hr), permanent symptom or invalidating injury e.g. failure of prophylaxis of atrial fibrillation; venous thromboembolism; decreased effect of clopidogrel on inhibition of platelet aggregation; ADE resulting from increased bioavailability of phenytoin; INR > 6.0; neutropenia 0.5-1.0x10 ⁹ /l; leucopenia 1.0-2.0x10 ⁹ /l; thrombocytopenia 25-50x10 ⁹ /l; severe diarrhea; myopathy (muscle complaints creatine kinase ≥10 times normal upper limit)
E	Uncommon ≥ 1/1,000 to < 1/100	Clinical effect (S): Failure of lifesaving therapy e.g. anticipated myelosuppression; prevention of breast cancer relapse; arrhythmia; neutropenia < 0.5x10 ⁹ /l; leucopenia < 1.0x10 ⁹ /l; thrombocytopenia < 25x10 ⁹ /l; life-threatening complications from diarrhea; rhabdomyolysis
F	Rare ≥ 1/10,000	Clinical effect (S): death; arrhythmia; unanticipated myelosuppression

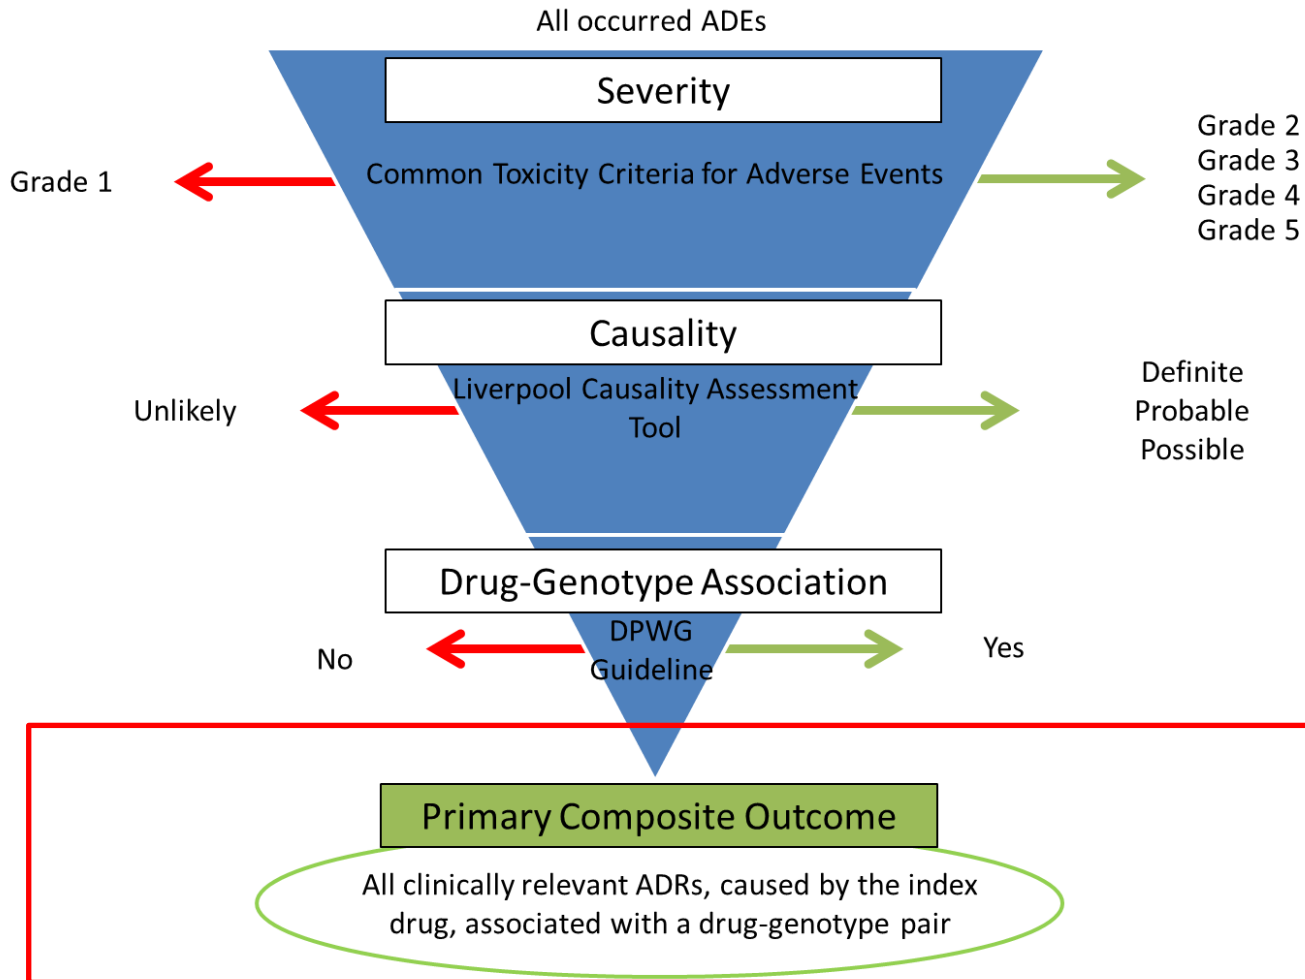

Endpoint - Drugs, Genes and Clinical Effect

		Clinical Effect Class						
Gene	Variant	AA	A	B	C	D	E	F
CYP2D6	PM		Amitryptiline Flecainide Zuclopenthixol Imipramine Pimozide	Atomoxetine Carvedilol Codeïne Oxycodone Tramadol	Aripiprazol Clomipramine Haloperidol Metoprolol Nortryptiline Propafenon Venlafaxine	Risperidone		Doxepine Tamoxifen
	IM		Codeïne Doxepine Flecainide Imipramine Propafenon Zuclopenthixol Oxycodone Pimozide	Metoprolol Tramadol	Amitryptiline Clomipramine Nortryptiline Risperidone Venlafaxine		Tamoxifen	
	UM		Doxepine Flecainide Imipramine Tamoxifen Venlafaxine Zuclopenthixol	Atomoxetine Oxycodone	Amitryptiline Clomipramine Haloperidol Nortryptiline Paroxetine Risperidone Tramadol	Metoprolol Propafenon		Codeïne

Primary endpoint:

- 30% reduction of **clinically relevant** adverse drug reactions (4 → 2.8%)
- Composite endpoint C,D,E,F

Primary Composite Endpoint

Example: Composite Endpoint

Patient in standard of care arm

- **Drug of inclusion:**
 - Codeine, normal dose
- **Adverse drug reaction:**
 - Respiratory depression
 - Severity: CTCAE Grade 5
 - Causality: LCAT Possible
- **Genotype:**
 - CYP2D6 Ultra Rapid Metabolizer
- **Drug genotype association:**
 - Described in the underlying literature of the codeine DPWG guideline to be associated with CYP2D6 UM

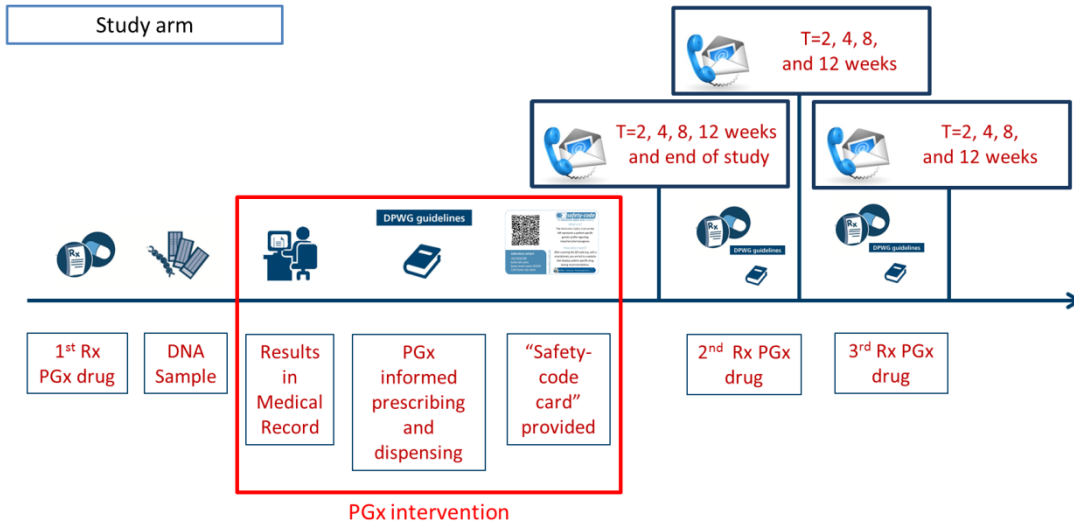

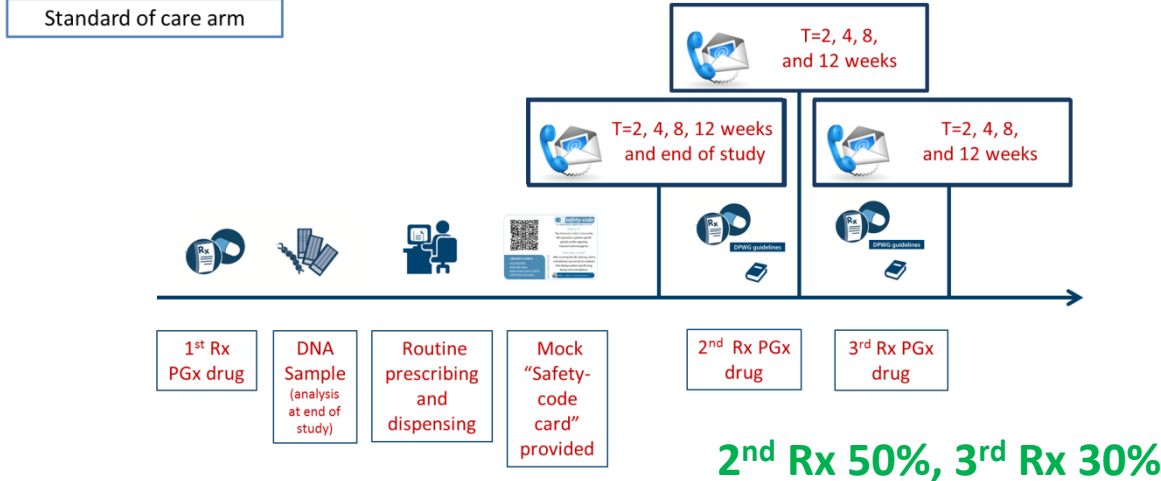

Secondary Endpoints

Secondary analyses of the U-PGx project are aimed at evaluating **quantitative and qualitative indicators** for successful implementation strategies.

- **Composite endpoint for all prescriptions**
- **Cost-effectiveness (incl QOL using the EQ5D questionnaire)**
- **Secondary clinical outcome measures**
 - Drug cessation (due to lack of efficacy, due to an ADR)
 - Dose alteration
 - Additional drugs prescribed
- **Survey of patients and physicians regarding:**
 - multi-domains (e.g. beliefs, knowledge, usability)
 - process indicators for implementation (e.g. guideline compliance, extent of adoption, number of tests) among patients and physicians
- **Patient reported outcomes (PROs)**
- **Routine drug levels**
- **Health-care consumption**

PREPARE: Data Collection

1. eCRF: ProMISe

Research Nurse Follow-up

Baseline (± 1 week)*
 4 weeks (± 1 week) *
 12 weeks (± 1 week)*
 End of Study (± 4 weeks)

*For every newly prescribed drug of interest

2. LIM

Online Survey Follow-up

2 weeks*
 8 weeks*

*For every newly prescribed drug of interest

Data collection: Lareb Intensive Monitoring (LIM) Survey

The screenshot displays the U-PGx website interface for the LIM Survey. At the top, there is a navigation bar with 'Home' and 'Log in' links. A central banner features a young child with arms raised. Below the banner, there are three main columns of content:

- Background information:** Explains the purpose of the survey and lists reasons for being contacted.
- Information about participation:** Details the frequency of surveys and the types of questions asked.
- Contact information:** Provides email addresses for the research team.

On the right side, a sidebar contains a list of survey sections: Welcome, Side-effect, Quality of life, Attitudes towards pharmacogenomics, and Completion. Below this list, a message states: '* All questions are mandatory' and 'Welcome to the PREPARE Study online survey! This survey will pose questions regarding your experiences with the drug: {{U-PGx medicine.surveymedicine}}, which you have started using 2 weeks ago. If you have stopped using this medication, please still fill in this survey.'

- Patient are able to report adverse events directly, without the intervention of a HCP
- Surveys are translated into local languages

Data collection: Electronic Case Report Form

The screenshot displays the ProMISe software interface. At the top left, the ProMISe logo and 'PREPARE' title are visible. A navigation menu on the left lists options like 'All programs', 'Data Entry only (simplified)', and 'Data Reports only'. The main area shows a patient record form with a table of 'PATIENT RECORDS' and a sidebar with 'Chapters & Sections'.

The 'PATIENT RECORDS' table is as follows:

value	label
800 Demo City [DEMO]	
1 1	
1.8 (1) INDEX DRUG	
1.8.1. (1) Index drug prescription	
Date of initiating index drug	2017/02/20 2017/02/20
Planned end date of index drug (if applicable)**	
Index drug for which patient was recruited	13 Codeine
Indication category	66 Other disease
Specific indication	Pain Pain
Total daily dose (units)*	
Units	
Dosing schedule	
Dose form	
Route of administration	
1.8.2 (1) Action ability	
Is the drug-gene interaction actionable?	
Does the DPWG recommend	

The sidebar 'Chapters & Sections' includes: Key Administration, 1.1 GENERAL INFORMATION, 1.2 INCLUSION AND EXCLUSION CRITERIA, 1.3 DEMOGRAPHICS, 1.4 RECRUITMENT INFORMATION, 1.5 HEALTH BEHAVIOURS, 1.6 DNA SAMPLE COLLECTION, 1.7 PHARMACOGENOMIC TESTING RESULTS, 1.8 (1) INDEX DRUG, 1.8 (2) SUBSEQUENT DRUG, 1.8 (3) SUBSEQUENT DRUG, 1.8 (4) SUBSEQUENT DRUG, 1.8 (5) SUBSEQUENT DRUG, 1.9 CONTROL FOR LOGISTICS, 1.10 SUBJECT WITHDRAWAL, 1.11 EXPENSES AND CASE REPORT FO..., and DATA FLOW.

- ProMISe facilitates us to store, exchange and retrieve data according to the security conditions demanded by GCP
- Each user has a personal log-in, facilitating an audit trail
- Scripted sections of eCRF are translated into local languages

Primary Statistical Analysis

Logistic regression analysis:

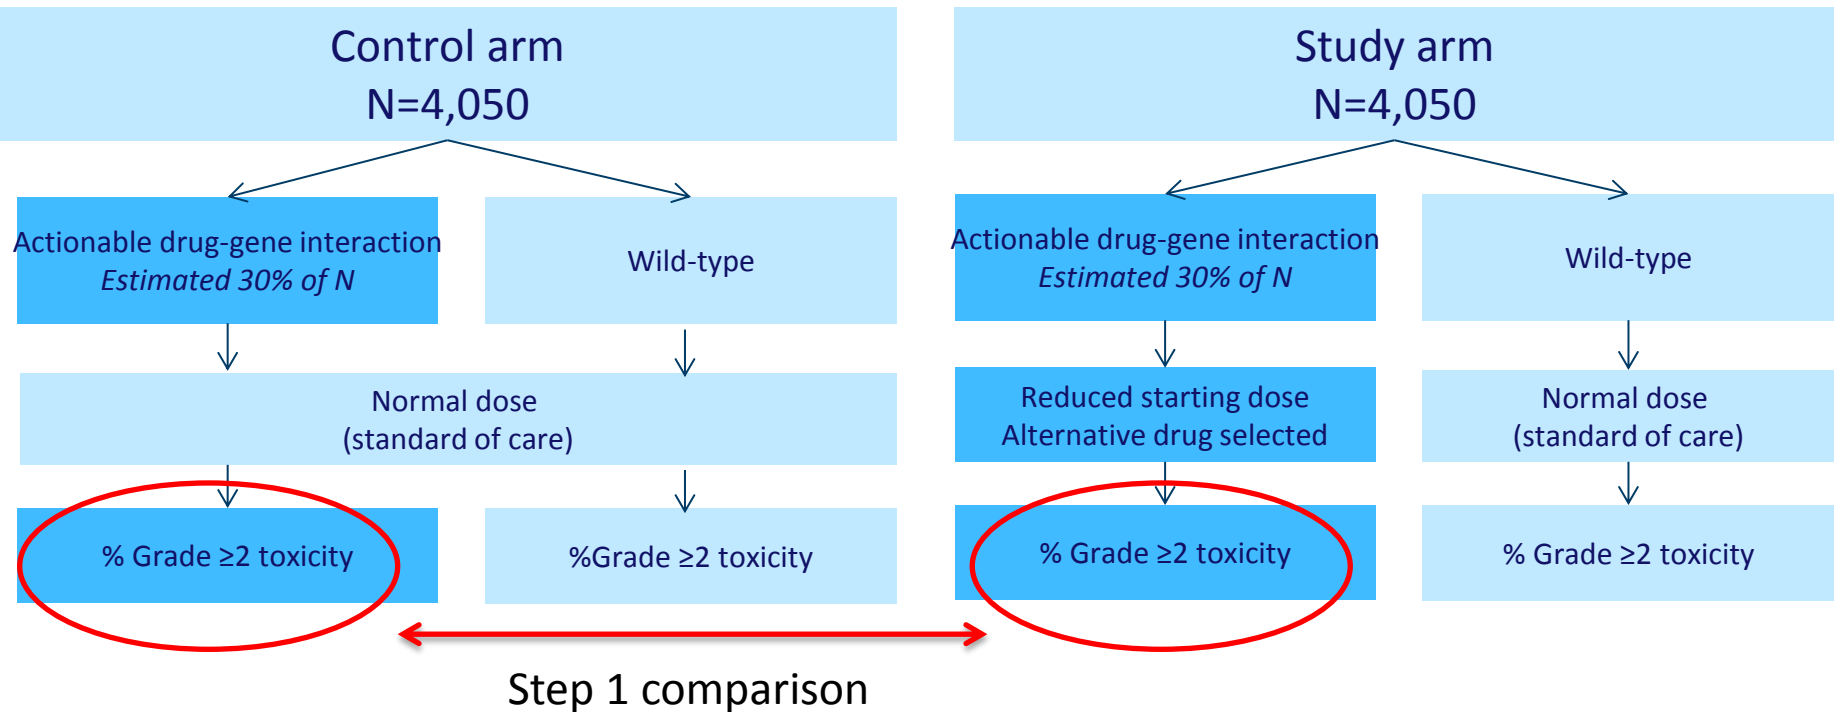

Number of patients who experience at least one ADR contributing to the primary composite endpoint in the study arm vs control arm

Gatekeeping analysis:

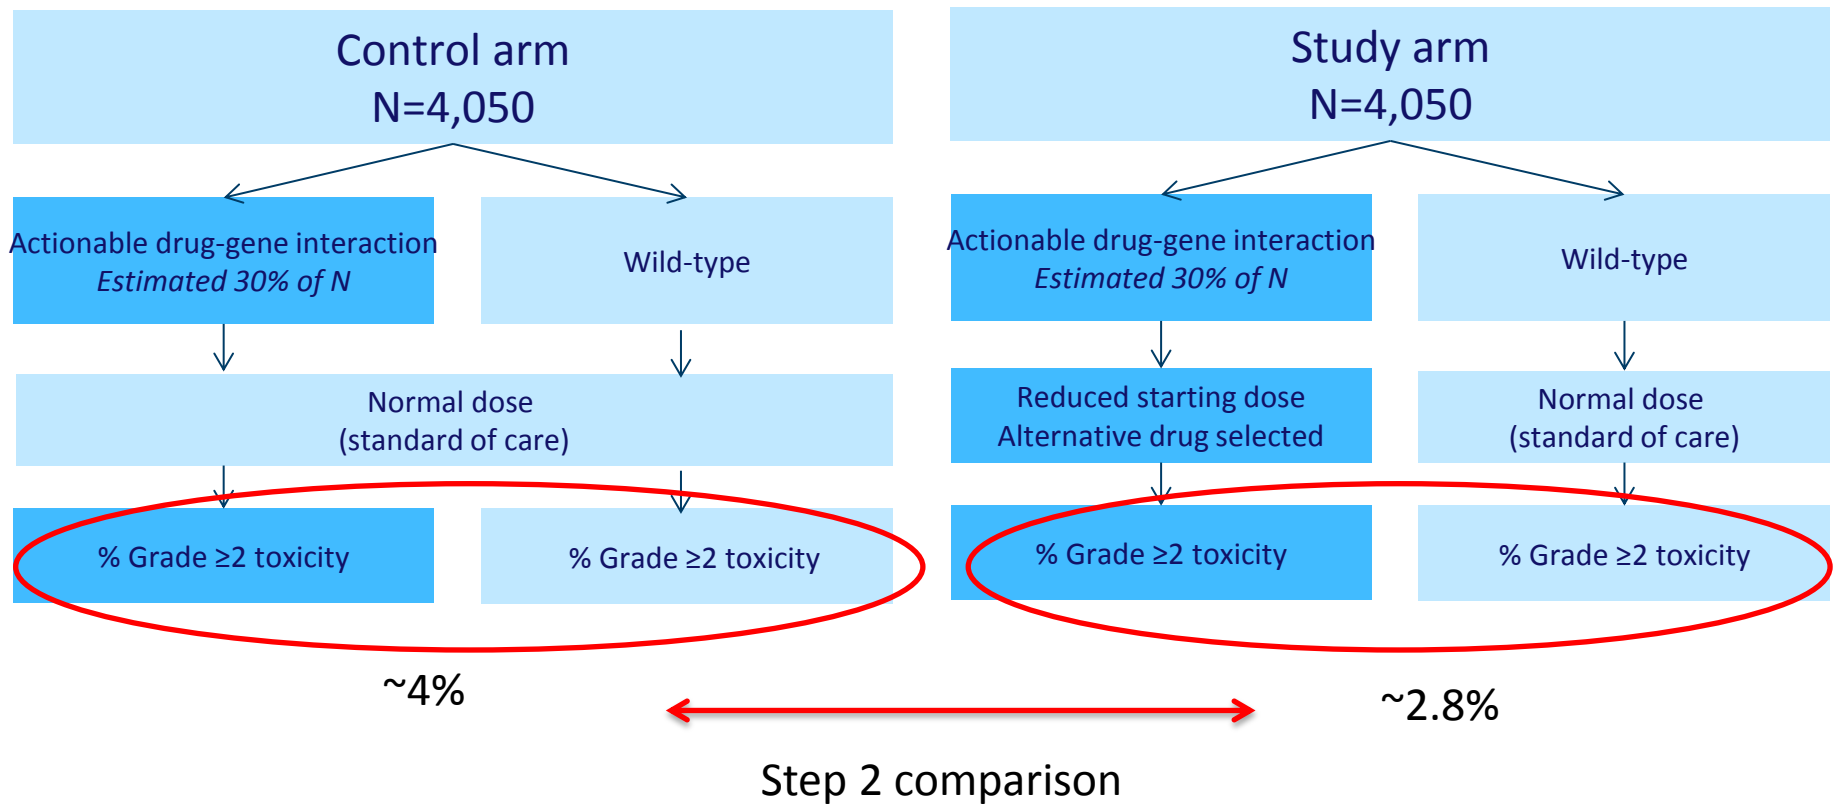

1. Among patients with an actionable drug-genotype interaction
2. Among all patients included in the study

1. Received Recommendation VS Did Not Receive Recommendation

2. All Patients Included

Component 3: A next step into the Future

Leader: Prof. Dr. Matthias Schwab

- **Follow-up study among extreme phenotypes:**

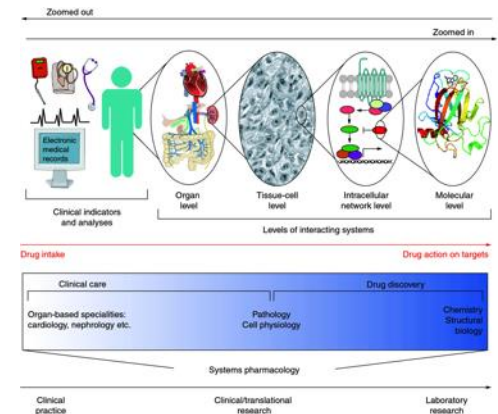

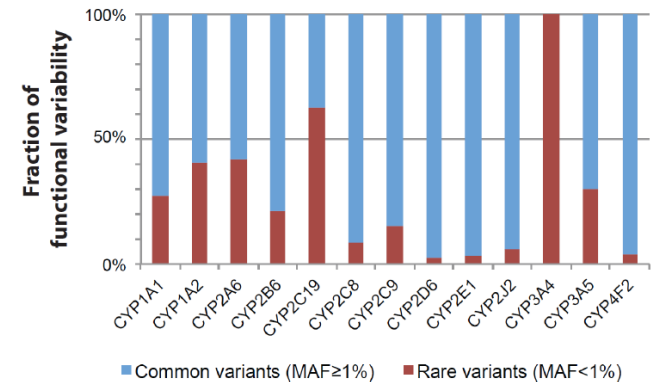

- Next Generation Sequencing
 - To identify rare variants
- Blood sample within 24 hours of serious ADR
 - Blood plasma levels of drugs

- **Pharmacokinetic sub-study:**

- Integrate Gene-Drug and Drug-Drug interactions
- Apply a systems pharmacology approach
 - Dried blood spot at various time points combined with clinical endpoint data

Rare variants among CYPs

Wist Genome Medicine 2009; 1: 11

A Next Step into the Future -- in more detail

- Extreme phenotype follow-up study

Objective: to identify rare variants associated with drug response.

- Collection of blood sample within 24 hours of ADR for blood plasma concentration of index drug
- NGS of 200 ADME genes

- Drug-Drug-Gene interaction sub-study

Among patients included in the PREPARE Study for a first prescription of metoprolol, capecitabine, 5-FU, atorvastatin, simvastatin or voriconazole

- Collection of dried blood spot at various time points
- Collection of clinical endpoint data

IV: ELSI, Dissemination and Communication

Leader: Christina Mitropoulou

- **Monitoring of all ethical and legal aspects** issued throughout the project and raising ELSI awareness within the U-PGx consortium
- **Increasing PGx awareness to professional stakeholders**, such as healthcare professionals, regulators, policy makers, representatives from ministries, pharmaceutical and biotechnology companies and patients' organizations; 8 U-PGx Personalized Medicine Days in 8 EU countries
- **Increasing PGx awareness to patients and the general public**; 2 major events will be organized in close cooperation with patients' organizations in London and Rome
- A **public-domain web-based PGx information portal** providing up-to date information for specialized scientists and healthcare professionals as well as for the general public and patients (www.upgx.eu)
- The majority of the data and results generated by U-PGx will be published in **open-access scientific journals**.

Current status

- ICT tools developed → msc card
- PGx genotyping platform selected → LGC SNPLine
- PGx panel selected → 13 pharmacogenes; 48 variants; incl. genotype-phenotype translation
- Guidelines translated → English and local languages; validated
- Training and education materials developed
 - Promotional video (www.upgx.eu)
 - eLearnings for participants (nurses, pharmacists, clinicians)
- First U-PGx Pharmacogenomics Day Granada Dec 2016; 2nd in Vienna May 12
- Study protocol finished
 - IRB approval for all sites
- SOPs completed e.g. logistics, causality assessment, genotyping
- **Recruitment started, first 40 patients recruited**

Future perspective and collaboration

- Routine PGx guided prescribing will become a reality in the EU in the near future
- PREPARE Study will quantify collective clinical utility of a panel of PGx-markers
- PREPARE is unique in its multi-center, multi-gene, multi-drug, multi-ethnic, and multi-healthcare system approach
- PREPARE will deliver a large dataset combining detailed phenotypes of adverse drug reactions and individuals' genetic makeup
- **U-PGx is open for collaboration to expand understanding of PGx**

Implementing Pharmacogenomics in Europe: Design and Implementation Strategy of the Ubiquitous Pharmacogenomics Consortium.
