

The Clinical Pharmacogenetics Implementation Consortium: Incorporating Pharmacogenetics into Clinical Practice and the EHR

Survey: Challenges to implementing pharmacogenetics in the clinic

What do you think is the most challenging aspect of the implementation of pharmacogenetics into the clinic?

- A. Translation of genetic information into clinical action
- B. Test cost, test reimbursement or other economic issues
- C. Availability of high quality genotyping test (CLIA approved)
- D. Electronic medical record use, such as the application of CDS
- E. Clinician and patient resistance and/or ethical concerns

Survey: top 3 Challenges to implementing pharmacogenetics in the clinic

- 95% of respondents selected: “process required to translate genetic information into clinical actions”
- Next 2 responses
 - Genotype test interpretation (e.g. using genotype information to impute phenotype)
 - Providing recommendations for selecting the drug/gene pairs to implement

- CPIC guidelines are designed to help clinicians understand HOW available genetic test results should be used to optimize drug therapy.
 - Not WHETHER tests should be ordered.
- Key Assumption:
 - Clinical high-throughput and pre-emptive genotyping will become more widespread.
 - Clinicians will be faced with having patients' genotypes available even if they did not order test with drug in mind.

- As of May 2018:
 - 261 Members
 - Clinicians and scientists
 - 181 institutions
 - 28 countries
 - 10 Observers (NIH and FDA)
 - CPIC Informatics
 - >20 members from 12 organizations

2011

- *TPMT* – thiopurines
- *CYP2C19*– clopidogrel
- *CYP2C9, VKORC1* – warfarin

2012

- *CYP2D6* – codeine
- *HLA-B* – abacavir
- *SLCO1B1* – simvastatin

2013

- *HLA-B* – allopurinol
- *CYP2D6, CYP2C19* – TCAs
- *HLA-B* – carbamazepine
- *DPYD* -- 5FU / capecitabine
- *TPMT* – thiopurines—UPDATE
- *CYP2C19* – clopidogrel--UPDATE

2014

- *IL28B* -- PEG interferon α
- *CFTR* -- Ivacaftor
- *G6PD* -- Rasburicase
- *CYP2C9, HLA-B* -- Phenytoin
- *CYP2D6* – codeine--UPDATE
- *HLA-B* – abacavir--UPDATE
- *SLCO1B1* – simvastatin—UPDATE

2015

- *CYP3A5* – tacrolimus
- *CYP2D6, CYP2C19*– SSRIs
- *UGT1A1* – atazanavir
- *HLA-B* – allopurinol—UPDATE

2016

- *CYP2C19* – voriconazole
- *CYP2D6* – ondansetron
- *CYP2C9, VKORC1* – warfarin--
UPDATE
- *CYP2D6, CYP2C19* – TCAs--UPDATE

2017

- *CYP2D6* – tamoxifen
- *HLA-B* – carbamazepine—UPDATE
- *DPYD* -- 5FU / capecitabine—UPDATE-in review

2018 (in progress)

- *RYR1*– inhaled anesthetics
- *CYP2B6*—efavirenz
- *TPMT/NUDT15* – thiopurines--UPDATE
- *CYP2D6*—atomoxetine
- *CYP2C19/PPI*
- *CYP2C9/HLA*-phenytoin—UPDATE
- *CYP2C9/celecoxib*

CPIC guidelines and list of CPIC genes/drugs

CPIC open meeting on 3/15/2017 in Washington DC - more details on the meetings page

What is CPIC?

The Clinical Pharmacogenetics Implementation Consortium (CPIC) was formed as a shared project between PharmGKB and the Pharmacogenomics

Background

One barrier to clinical implementation of pharmacogenetics is the lack of freely available, peer-reviewed, updatable, and detailed gene/drug clinical

CPIC website: www.cpicpgx.org

Guidelines

CPIC guidelines are designed to help clinicians understand HOW available genetic test results should be used to optimize drug therapy, rather than WHETHER tests should be ordered. A key assumption underlying the CPIC guidelines is that clinical high-throughput and pre-emptive (pre-prescription) genotyping will become more widespread, and that clinicians will be faced with having patients' genotypes available even if they have not explicitly ordered a test with a specific drug in mind. CPIC's guidelines, processes and projects have been endorsed by several professional societies – [read more](#).

Each CPIC guideline adheres to a standard format, and includes a standard system for [grading levels of evidence linking genotypes to phenotypes](#), how to assign phenotypes to clinical genotypes, prescribing recommendations based on genotype/phenotype, and a standard system for assigning [strength to each prescribing recommendation](#). The SOP for guideline creation has been published in Current Drug Metabolism: [Incorporation of Pharmacogenomics into Routine Clinical Practice: The Pharmacogenetics Implementation Consortium \(CPIC\) Guideline Development Process](#). The [CPIC authorship guidelines](#) were updated in June 2014.

Thiopurine methyltransferase deficiency - Conditions - ...

Thiopurine methyltransferase deficiency

SNOMED CT: Thiopurine methyltransferase deficiency, ID: 238012003

Related Conditions

C R O G Thiopurine methyltransferase deficiency

Associated Genes

[TPMT](#)

Summary: thiopurine S-methyltransferase

Clinical Features

[Imported from OMIM](#) [Show all](#)

- Caused by mutation in the thiopurine S-methyltransferase gene (TPMT, 187680.0001)
- Decreased activity of thiopurine S-methyltransferase
- Decreased metabolism of thiopurine drugs
- Hematopoietic toxicity develops on standard doses of thiopurine drugs
- Heterozygotes may also show increased susceptibility to toxic effects of thiopurine treatment

Establishing transparency	
<p>1.1 The process for developing a clinical practice guideline (CPG) – including funding – should be explicitly described and publicly accessible.</p>	<p><i>In the initial article articulating the need for pharmacogenetics guidelines Relling and Klein outlined the CPIC process [1]. This article does not describe funding, but CPIC funding (currently via NIGMS) is fully and publicly disclosed in each guideline and on its webpage on PharmGKB (http://www.pharmgkb.org/page/cpic and http://www.pgrn.org/display/pgrnwebsite/PGRN+Home). The current publication provides additional transparency for the CPIC guideline development process.</i></p>

Clinical Pharmacogenetics Implementation Consortium (CPIC) Guidelines for *CYP2C19* and Voriconazole Therapy

B Moriyama¹, A Owusu Obeng^{2,3,4}, J Barbarino⁵, SR Penzak⁶, SA Henning¹, SA Scott^{2,7}, JAG Agúndez⁸, JR Wingard⁹, HL McLeod¹⁰, TE Klein⁵, SJ Cross^{11,12}, KE Caudle¹¹ and TJ Walsh¹³

Clin Pharmacol Ther. 2017 Jul;102(1):45-51.

Table 1 Assignment of likely CYP2C19 phenotypes based on genotypes

Likely phenotype	Genotypes ^a	Examples of CYP2C19 diplotypes
CYP2C19 ultrarapid metabolizer (~2–5% of patients) ^b	An individual carrying two increased function alleles	*17/*17
CYP2C19 rapid metabolizer (~2–30% of patients) ^b	An individual carrying one normal function allele and one increased function allele	*1/*17
CYP2C19 normal metabolizer ^c (~35–50% of patients) ^b	An individual carrying two normal function alleles	*1/*1
CYP2C19 intermediate metabolizer (~18–45% of patients) ^b	An individual carrying one normal function allele and one no function allele or one no function allele and one increased function allele	*1/*2, *1/*3, *2/*17 ^d
CYP2C19 poor metabolizer (~2–15% of patients) ^b	An individual carrying two no function alleles	*2/*2, *2/*3, *3/*3

^aAssignment of allele function (CYP2C19 allele definition table) and citations for allele function (CYP2C19 allele functionality references) are posted to PharmGKB.org.²

^bSee the CYP2C19 frequency table (link to PharmGKB) for race specific allele and phenotype frequencies. ^cBased on the Clinical Pharmacogenetics Implementation Consortium (CPIC) term standardization project (reference in press), the term "normal metabolizer" will be used instead of the term "extensive metabolizer" in all new and updated CPIC guidelines. ^dThe predicted metabolizer phenotype for the *2/*17 genotypes is a provisional classification. The currently available evidence indicates that the CYP2C19*17 increased function allele is unable to completely compensate for the no function CYP2C19*2 (5). See **Supplementary Materials** online for a more comprehensive list of predicted metabolizer phenotypes.

Table 2 Dosing recommendations for voriconazole treatment based on CYP2C19 phenotype for adult patients

CYP2C19 phenotype	Implications for voriconazole pharmacologic measures	Therapeutic recommendations	Classification of recommendations ^a
CYP2C19 ultrarapid metabolizer (*17/*17)	In patients for whom an ultrarapid metabolizer genotype (*17/*17) is identified, the probability of attainment of therapeutic voriconazole concentrations is small with standard dosing	Choose an alternative agent that is not dependent on CYP2C19 metabolism as primary therapy in lieu of voriconazole. Such agents include isavuconazole, liposomal amphotericin B, and posaconazole. ^b	Moderate ^c
CYP2C19 rapid metabolizer (*1/*17)	In patients for whom a rapid metabolizer genotype (*1/*17) is identified, the probability of attainment of therapeutic concentrations is modest with standard dosing	Choose an alternative agent that is not dependent on CYP2C19 metabolism as primary therapy in lieu of voriconazole. Such agents include isavuconazole, liposomal amphotericin B, and posaconazole. ^b	Moderate
CYP2C19 normal metabolizer	Normal voriconazole metabolism	Initiate therapy with recommended standard of care dosing ^b	Strong
CYP2C19 intermediate metabolizer	Higher dose-adjusted trough concentrations of voriconazole compared with normal metabolizers	Initiate therapy with recommended standard of care dosing ^b	Moderate
CYP2C19 poor metabolizer	Higher dose-adjusted trough concentrations of voriconazole and may increase probability of adverse events	Choose an alternative agent that is not dependent on CYP2C19 metabolism as primary therapy in lieu of voriconazole. Such agents include isavuconazole, liposomal amphotericin B, and posaconazole. ^b In the event that voriconazole is considered to be the most appropriate agent, based on clinical advice, for a patient with poor metabolizer genotype, voriconazole should be administered at a preferably lower than standard dosage with careful therapeutic drug monitoring.	Moderate

^aRating scheme is described in **Supplementary Data** online. ^bFurther dose adjustments or selection of alternative therapy may be necessary due to other clinical factors, such as drug interactions, hepatic function, renal function, species, site of infection, therapeutic drug monitoring, and comorbidities. ^cRecommendations based upon data extrapolated from patients with CYP2C19*1/*17 genotype.

Translating CYP genotypes to allelic functional status

Term/gene category	Final term^a	Functional definition	Genetic definition	Example diplotypes/alleles
Allele functional status: all genes	Increased function	Function greater than normal function	N/A	<i>CYP2C19*17</i>
	Normal function	Fully functional/wild-type	N/A	<i>CYP2C19*1</i>
	Decreased function	Function less than normal function	N/A	<i>CYP2C19*9</i>
	No function	Nonfunctional	N/A	<i>CYP2C19*2</i>
	Unknown function	No literature describing function or the allele is novel	N/A	<i>CYP2C19*29</i>
	Uncertain function	Literature supporting function is conflicting or weak	N/A	<i>CYP2C19*12</i>

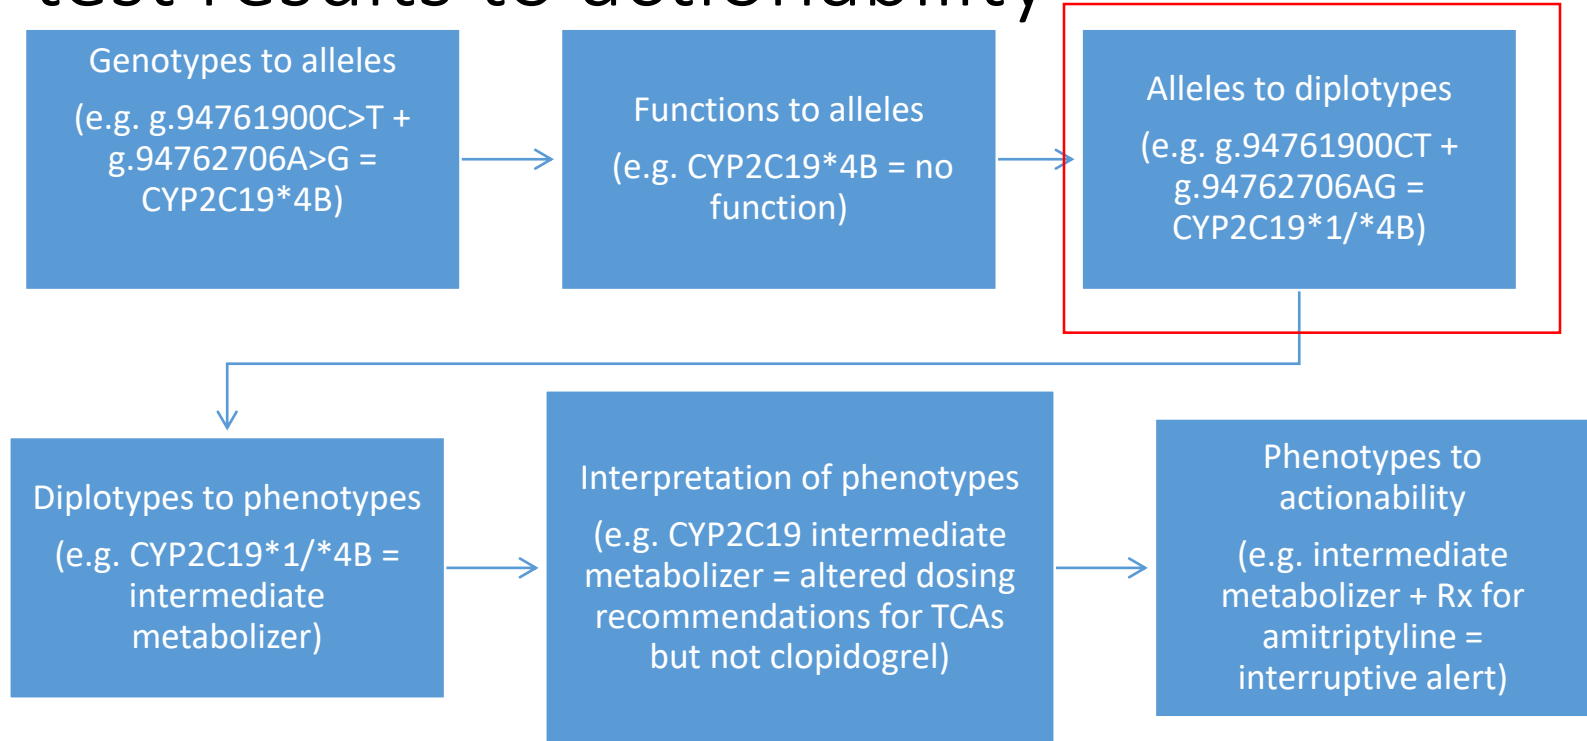

Allele functionality table: alleles to function

The referenced substrates and cited articles are examples and may not represent all information that may be available for an allele.

Genotype to phenotype assignment based on allele function

Table 1 Assignment of likely CYP2C19 phenotypes based on genotypes

Likely phenotype	Genotypes ^a	Examples of CYP2C19 diplotypes
CYP2C19 ultrarapid metabolizer (~2–5% of patients) ^b	An individual carrying two increased function alleles	*17/*17
CYP2C19 rapid metabolizer (~2–30% of patients) ^b	An individual carrying one normal function allele and one increased function allele	*1/*17
CYP2C19 normal metabolizer ^c (~35–50% of patients) ^b	An individual carrying two normal function alleles	*1/*1
CYP2C19 intermediate metabolizer (~18–45% of patients) ^b	An individual carrying one normal function allele and one no function allele or one no function allele and one increased function allele	*1/*2, *1/*3, *2/*17 ^d
CYP2C19 poor metabolizer (~2–15% of patients) ^b	An individual carrying two no function alleles	*2/*2, *2/*3, *3/*3

Clin Pharmacol Ther. 2017 Jul; 102 (1):45-51.

<https://cpicpgx.org/guidelines/guideline-for-voriconazole-and-cyp2c19/>

Genotype to phenotype assignment based on allele function

Table 1 Assignment of likely CYP2D6 phenotypes based on diplotypes

Likely phenotype	Diplotypes
CYP2D6 Ultrarapid (~1-2% of patients)	2xN ^c
CYP2D6 Normal (~77-92% of patients)	/ *5, 41/ *41
CYP2D6 Intermediate (~2-11% of patients)	
CYP2D6 Poor Metabolizer (~5-10% of patients)	/ *6

There are differences in genotype to phenotype assignment between the CPIC and the DPWG guidelines. We are in the process of working together to resolve these discordances.

Discern: (2 of 2)

WARNING

Based on the genotype result, this patient is predicted to be a TPMT-INTERMEDIATE METABOLIZER. The patient is at risk for myelosuppression with normal doses of 6-mercaptopurine. Consider starting 6-mercaptopurine doses at 30 - 70% of the normal dose. Please consult a clinical pharmacist or review the pharmacogenetics tab for more information.

Alert Action

- Cancel entry
- Dose altered accordingly
- Modify

History Add info OK

Drive CDS off of problem list entry

Post-test alert can incorporate non-genetic info too: based on CYP2C19 phenotype, route of administration, age

Discern: (2 of 2)

POOR METABOLIZER

Based on the genotype result, this patient is predicted to be a **CYP2C19 POOR METABOLIZER**. If voriconazole is prescribed to a CYP2C19 poor metabolizer adverse events are likely. **For a patient 12 years of age or older and a CYP2C19 PM phenotype**, initiate voriconazole at a reduced dose of **200 mg PO Q12H** and follow up with therapeutic drug monitoring. Please consult a clinical pharmacist, review the pharmacogenetics tab or click on the link below for more information.

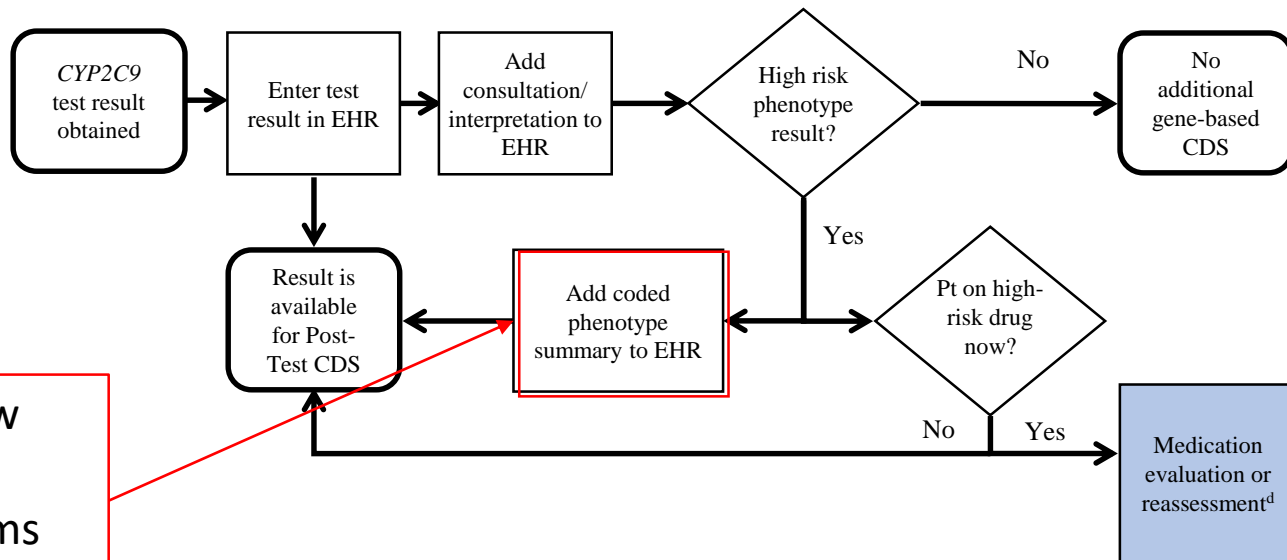

Alert Action

Check BELOW for age and phenotype adjusted dose

Continue with different dose

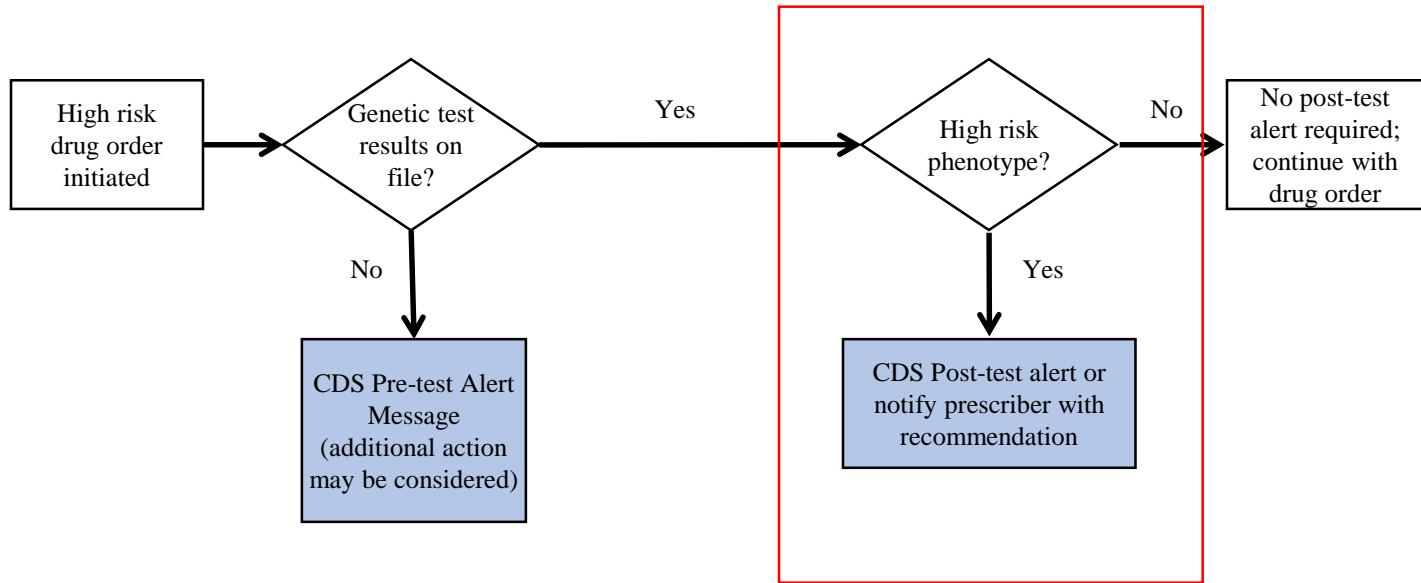

Add Order for:

Voriconazole oral -> 200 mg = PO Q12H, Routine, CYP2C19 POOR METABOLIZER. Age 12 years or above

There are now available SNOMED terms for phenotypes

CPIC® Guideline for Thiopurines and TPMT

Most recent guideline publication:

[Clinical Pharmacogenetics Implementation Consortium Guidelines for Thiopurine Methyltransferase Genotype and Thiopurine Dosing \(March 2011\)](#) 

Updates since publication:

May 2016: Several studies have reported that individuals who carry low-function alleles for *NUDT15* are unable to tolerate usual doses of thiopurines.[Yag SK et al. Nat Genet. 2014;46:1017, Yang JJ et al. J Clin Oncol. 2015;33:1235, Tanaka Y et al. Br J Haemtol. 2015;171:109, Kakuta Y et al. Pharmacogenomics J. 2015 doi: 10.1038/tpj.2015.43, Chiengthong K et al. Haematologica. 2016;101:e24, Liang DC et al. Pharmacogenomics J. 2015 doi: 10.1038/tpj.2015.75, Asada A et al. J Gastroenterol. 2016;51:22, Lee YJ et al. Eur J Gastroenterol Hepatol.2016;28:475, Moriyama T et al. Nat Genet. 2016;48:367] These alleles are more common among those of Asian ancestry and Hispanic ethnicity than others.[Yang JJ et al. J Clin Oncol. 2015;33:1235, Moriyama T et al. Nat Genet. 2016;48:367] The dose tolerated by those with two low-function alleles is only ~ 10% that tolerated by those with no low-function *NUDT15* or *TPMT* alleles.[Yang JJ et al. J Clin Oncol. 2015;33:1235, Moriyama T et al. Nat Genet. 2016;48:367] CPIC is planning a guideline to address *NUDT15* variants and possible dosing recommendations for thiopurines.

These studies have been annotated on PharmGKB - [click](#) for more information.

April 2013: Guideline authors reviewed additional literature and concluded that none of the evidence would change the therapeutic recommendations in the 2011 guideline; therefore, the 2011 guideline remains clinically current. The guideline supplement and evidence table were updated (see below).

- ↓ TPMT and/or NUDT15 activity =
- ↑ myelosuppression
- CPIC guideline update will include *NUDT15*

The Pharmacogene Variation (PharmVar) Consortium is a central repository for pharmacogene (PGx) variation that focuses on haplotype structure and allelic variation. The information in this resource facilitates the interpretation of pharmacogenetic test results to guide precision medicine.

The **Pharmacogene Variation** (PharmVar) Consortium is the new home for PGx gene nomenclature and serves as a centralized "Next-Generation" Pharmacogene Variation data repository. After more than 15 years, the Human Cytochrome P450 (CYP) Allele Nomenclature website has been transitioned from its original location at the Karolinska Institutet in Sweden to Children's Mercy in Kansas City, USA. The new interactive PharmVar database launched on March 21st, 2018 and contains the high-priority CYP2C9, CYP2C19 and CYP2D6 genes. Other P450 genes will be transferred to PharmVar within the first year of the project (once a gene is transferred into PharmVar, it will receive legacy status on the Nomenclature website). Other PGx genes including clinically actionable CPIC genes will be added in the future.

PharmVar Publication

An inaugural article on PharmVar has been published in [Clinical Pharmacology & Therapeutics](#). Details available on the [resources](#) page.

Original content from the [cypalleles.ki.se](#) site is available through the [archive](#)
